Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Sequences shown in ANV41169 to ANV41181 represent antisense CC oligonuclectides to the RNA component of human telomerase (htm). These CC antisense oligonuclectides specifically hybridise to a nucleotide sequence within an accessible region of the hTR, but that does not hybridise to a sequence within the template region of hTR. These CC component of human telomerase in a sample. This is useful for diagnosing CC cancer (especially neuroblastenca, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory oligonucleotides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component decreasing the CC oligonucleotides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component transcript, inhibiting assembly of the RNA component into the telomerase holoenzyme, or inhibiting the bused for inhibiting telomerase activity in both cultured cells and in used for inhibiting telomerase activity in both cultured cells and in CC cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immune system, e.g. a specific subset of T-cells, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

```
The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods involve the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing positive charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for blochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase,
New polynucleotide(s) anti:sense to human telomerase - used detecting or inhibiting human telomerase, e.g. for treating contraception, immuno-suppression or treating infection
                                                                                                                                                                                                                                                                      20-DEC-1996;

                      This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 60000-fold) increased relative purity compared with crude extract of cells from adenovirus-transformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. AAZ33626-Z3637 represent oligonucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         eliciting an immune response in animals and may therefore be used vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. AAR23662-R23637 represent oligonucleotides in the isolation of human clone 28-1 which contains a fragment of human telomerase described in the method of the invention.

                                                                                                                    The sequence represents an antisense oligonucleotide used in
the purification of human telomerase. The invention relates
to a purified human telomerase are invention relates
to a purified human telomerase core enzyme protein comprising
2000-fold increased purity compared with a crude extract of cells from
adenovirus-transformed kidney cell line (293 cells) and when associated
with telomerase RNA component has DNA polymerase activity and a molecular
weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful
for inducing a humoral or cell-mediated immune response in an animal.
Purified telomerase or immunogenic fragments are useful as vaccines for
treating diseases associated with over-expression of telomerase, such as
cancer and for producing antibodies that recognize telomerase, such as
cancer and for producing antibodies that recognize telomerase, which are
useful as affinity agents in isolating the proteins and for detecting the
presence of proteins in a sample, such as cell or tissue. Identification
of telomerase and/or telomerase associated proteins that alter the association of
telomerase-associated proteins, such as nucleolin or EP2H with
                                                                                                                                                                                                                                                                                                                                               Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with cytoplasmic crude cell preparations -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAS09477;

The sequence represents a biotinylated antisense oligonucleotide
C used in the purification of human telomerase. The invention
C relates to a purified human telomerase or the invention
C relates to a purified human telomerase or the invention
C 2000-fold increased purity compared with a crude extract of cells from
C adenovirus-transformed kidney cell line (293 cells) and when associated
C with telomerase RNA component has DNA polymerase activity and a molecular
C weight of 200-2000 kilo baltons (kba). The purified telomerase is useful
C for inducing a humoral or cell-mediated immune response in an animal.
C purified telomerase or immunogenic fragments are useful as vaccines for
C treating diseases associated with over-expression of telomerase, such as
C cancer and for producing antibodies that recognize telomerase, which are
C useful as affinity agents in isolating the proteins and for detecting the
C presence of proteins in a sample, such as cell or tissue. Identification
C of telomerase and/or telomerase associated proteins are also useful for
C screening compounds to identify agents that alter the association of
C telomerase-associated proteins, such as nucleolin or EF2H with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with cytoplasmic crude cell preparations -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2001-450477/48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Telomerase; vaccine; antibody; cancer; EF2H; nucleolin; antisense oligonucleotide; Oligo 14ab; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense oligonucleotide for human telomerase, Oligo 14ab #2

                                                                                                                                coligonucleotides to the RNA component of human telomerase (hTR). These can missense oligonucleotides specifically hybridise to a nucleotide: sequence within an accessible region of the hTR, but that does not hybridise to a sequence within the template region of hTR. These coligonucleotides may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory cancer providing prognosis for a cancer patient. The inhibitory oligonucleotides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component, decreasing the half-life of the telomerase RNA component transcript, inhibiting assembly collegated for inhibiting the telomerase holoenzyme, or inhibiting the colymerase activity of telomerase. These antisense oilgonucleotides can be used for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or preventing cancer. For contracer for correct or sterilisation.
                                                                 Matches
                                                                               Query Match

                                                                                                                                                                                                                                                                   AAQ71911 to AAQ71975 are primers for the human II-2R gammma gene, the were used to amplify DNA from mutated and normal II-2R gamma genes. The mutated gene DNA was obtained either from female carriers or male sufferers of X-linked severe combined immunodeficiency (XSCID). The amplified DNA from normal and affected individuals was then compared using a variety of methods including northern blotting and dot and slot hybridisation. From this a claimed method for the diagnosis of XSCID carriers and sufferers was developed.
                                                                                                                                                                                                                                                                                                                                                                                             Diagnosis of X-linked severe combined immunodeficiency (XSCID) comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene

The mutated gene DNA was obtained either from female carriers or male sufferers of X-linked severe combined immunodeficiency (XSCID). The amplified DNA from normal and affected individuals was then compared using a variety of methods including northern blotting and dot and slot hybridisation. From this a claimed method for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosis of X-linked severe combined immunodeficiency (XSCID) comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12-MAR-1993;

The invention provides vertebrate (human) protein homologue of a UNC-53 CC protein of Caenorhabditis elegane. The UNC-53 binds to microtubules or their plus ends. The UNC-53 sequences are used to promote neural CC regeneration, revascularization and wound healing; also for treating CC neurodegenerative disease, acute traumatic injury, fibrotic disease and cautoimmune diseases (e.g. rheumatoid arthritis and sclerosis). The UNC-53 polymucleotides can be used for recombinant production of the CC proteins, as a source of probes for detecting allelic variants and CC expression; and as source of therapeutic antisense sequences. Cells that CC express the protein are used to identify regulators of cell shape, CC growth, motility and migration. They can also be used to identify compounds that alter attachment of UNC-53 to CC expression. At target gene coupled to a UNC-53 encoding sequence may be used to deliver the target gene co a cellular microtubule or its plus cands. Sequences AAAO7902-7911 represent primers specific for Hs-UNC-53/2 used in RT-PCR studies of Hs-UNC-53/2 expression.

This invention describes a novel protein heteromer, containing at least a GABA-B receptor protein and at least a protein (A) or a sequence which has a substitution, inversion, insertion or deletion of one or more amino

has a substitution, acid residues and w

Example 5; Page 27; 66pp; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC acid residues and which has neuroprotective activity of the protein CC heteromer and which has neuroprotective activity. The encoding nucleic acid (I), the construct, (A) or the protein heteromer are useful for CC acid (I), the construct, (A) or the protein heteromer are useful for CC identifying proteins (or nucleic acids encoding such proteins) that show a specific binding affinity to (A) or the protein heteromer. The two-hybrid CC system or biochemical methods can be used to identify interaction domains CC identifying and manufacture of substances which have specific binding CC identifying and manufacture of substances which have specific binding CC activity to the protein or protein complex is useful for CC activity to the protein or protein complex. The protein heteromer and CC mono- or polyclonal antibodies. (I) is useful for identifying and cC isolating homologous sequences, as a marker for human disease and for CC gene therapy. The methods can be used to identify substances, which bind CC interaction of the GABAETQIC signal messages in neurons of the central CC amplify interactions of (A) with other metabotropic receptors or interactions of (A) with G-proteins or other signal transduction molecules. The CC analysis of the interactions of (A) and GABA-B receptors is important conforting homologous active substances and has substances and has substances and has an of the interactions of (A) and GABA-B receptors is important conforting potential active substances are avained diseases such as

cc identifying and manufacture of substances which have specific binding cativity to the protein or protein complex. The protein heteromer and (A) cc or fragments of these are useful as antigens to generate specific monocc or polyvlonal antibodies. The encoding nucleic acid (I) is useful for disease and for gene therapy. The methods can be used to identify substances, which bind to (A) or (I) and that cause inhibition or continuous of the central nervous system. The method can also identify substances that inhibit or amplify interactions of (A) with other substances that inhibit or amplify interactions of (A) with other the central nervous system. The method can also identify substances that inhibit or amplify interactions of (A) with other the control of the central nervous system. The method can also identify substances that inhibit or amplify interactions of (A) with other the control of the control of the protein of the control of the control of the protein of the control of the control of the protein of the protein of the control of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A novel related ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for gene therapy. (A) or the protein heteromer are useful for identifying proteins (or nucleic acids encoding such proteins) that show specific binding affinity to (A) or the protein heteromer. The two-hybrid system or biochemical methods can be used to identify interaction domains of metabotropic receptors and use for pharmacotherapeutic intervention. Structural information from the protein or protein complex is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel protein heteromer, containing at least a GABA-B receptor protein and at least a protein (A) or its derivative which retains the biological activity of the protein heteromer. The protein of the invention has neuroprotective activity and can be used for gene therapy. (A) or the protein heteromer are useful for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 5; Page 11; 32pp; German
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   metabotropic receptor complex from the central nervous system, coding sequences and methods of identifying binding substances, and interactions with other proteins

A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .752/c

          The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker

sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell complete containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal conditions of the specified by using the above primer; (g) signals credited throm the amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions of the chromosome and arrayed. The creometituted as the positions on the chromosome and arrayed. The creometituted as the positions of the chromosome and arrayed. The creometituted as the positions on the present and the positions are conditionally claimed for use in the present invention.

INFORMATION FOR SEQ ID NO: 17:
SEQUENCE CHARACTERISTICS:
LENGTH: 31 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: linear
NOLECULE TYPE: DNA (oligonucleotide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 62894, Application PC/TUS0225943

Sequence 62894, Application PC/TUS0225943

Sequence 62894, Application PC/TUS0225943

SEQUENCE INFORMATION: Beaudomonas aeruginosa PA01, complete genome.

FILE OF INVENTION: Beaudomonas aeruginosa PA01, complete genome.

FILE REFERENCE: Jim Zegeer Law Offices - 703-684-8333

CURRENT APPLICATION UNMERR: PCT/US02/25943

CURRENT FILING DATE: 2002-08-27

NUMBER OF SEQ ID NOS: 64158

SOPTWARE: Proprietary

SEQ ID NO 62884

LENGTH: 32

TYPE: DNA

ORGANISM: Pseudomonas aeruginosa PA01, complete genome.

PEATURE:

FEATURE:

FOATION: (6132858)...(6132888)

OTHER INFORMATION: Chromosome = 1 Strand = positive ConnectronObjectNumber = 67367
